

AC Calibration System

With the Stansteel Automatic A.C. Calibration System using the proper piping and valving, the A.C. can be diverted from the run line on the plant directly to the A.C. calibration tank. The tank is loaded with a specific amount of material and then stopped with a weight registered on the electronic digitizer located in the control house. After the material is weighed, the process can be reversed and pumped back to the AC storage tank so that no waste occurs.

Benefits:

- Reduced mix temps save fuel
- Cost-effective tank management
- High return on investment when grade bumping
- Reduction in roller passes
- Increased haul times
- Increased storage times
- Reduced emissions
- Increased workability
- Ability to expand into tomorrow's market
- SUPERIOR coating of aggregates during HMA and WMA production
